CUSTOMER SUCCESS STORY:

Japan Infrastructure Waymark grows inspection business 70x in 12 months by switching from DJI to Skydio for bridge inspection

- 75% cost savings
- 92% reduction in pilot training hours
- 70X growth in bridges inspected per year
Executive Summary

Japan Infrastructure Waymark (JIW) is a rapidly growing drone service provider (DSP) serving the Japanese bridge inspection market from its headquarters in Tokyo. A wholly-owned subsidiary of telecom giant NTT, JIW was founded in April 2019 to provide bridge and culvert inspections to Japan’s network of approximately 714,000 bridges. JIW provides detailed inspection reports to both private entities and government groups across the country. The team comprises 70 internal and external pilots distributed across Japan.

At its founding, JIW was designed to do inspections using drones, which at that point in time were fundamentally manual, such as DJI, Autel, and Parrot, expecting that the cost advantage from using drones vs. incumbent methods such as climbers and snooper trucks would enable the team to rapidly gain market share. However, early testing exposed these options as unable to build a scalable business model. These drones’ inability to fly in metallic and GPS-denied environments – such as below reinforced concrete bridge decks – prevented them from capturing the precise imagery required to replace the expensive incumbent methods. Further, the extensive training required to teach pilots how to keep their manual drones from crashing on the job, bringing additional capital expense and liability risk, prevented JIW from realizing any human capital advantages.

HEADQUARTERS

INDUSTRY
Inspection (Drone Service Provider)

CHALLENGE
Manual drones (DJI, Autel, Parrot) were incapable of safely inspecting bridges with the level of precision required for official inspections of Japan’s 714,000 bridges

SOLUTION
Fleet of 300+ Skydio 2 aircraft with Skydio Autonomy Enterprise Foundation for fast, safe, and accurate bridge inspections

RESULTS
• Skydio provides 75% cost advantages over pre-drone methods on jobs that manual drones cannot perform.
• JIW has on-boarded 68 pilots in 12 months by using Skydio Autonomy™ to lower the training burden for bridge inspectors from 100 to 8 hours.
• JIW provides higher quality inspection reports, both in traditional report formats and 3D Models.

Switching to Skydio has allowed JIW to onboard new pilots in a fraction of the time. Source: Skydio

After an extensive testing process that evaluated DJI, Parrot, Autel, and Skydio drones, the JIW team chose Skydio, citing the onboard intelligence of Skydio Autonomy as the key enabler for their business model. Thanks to Skydio drones’ ability to fly in environments where manual drones cannot maintain stable flight, and the addition of Skydio Autonomy Enterprise Foundation to enhance the flight experience with AI-pilot assistance capabilities, JIW has successfully expanded their Skydio 2 fleet to over 300 aircraft, equipped and trained 68 operators to perform bridge inspections over a span of 12 months, while growing their overall business from 10 bridges inspected in 2019 to a projected 700 bridges in 2021.

"Thanks to Skydio Autonomy, our inspectors can benefit from AI-powered obstacle avoidance, which enables safe flights in the GPS- and magnetometer-denied areas that are prevalent under bridges we inspect.

No other drone came close to successfully completing bridge inspection missions in our trials process, and we are thrilled to be able to adopt Skydio’s new technologies."

- TAKUMI SHIBATA, CEO OF JIW

Challenges

Like bridge inspectors worldwide trying to apply manual drones, JIW found the hardware-centric UAS options to be incapable of successfully completing the job. With high precision requirements, JIW needed to fly in and among bridge trusses, where metal structures interfere with magnetometers, and overhead concrete prevents GPS location. As a result, manual drones were incapable of flying stably under bridges, and required extensive pilot training just to prevent the aircraft from crashing, let alone complete an inspection. The consequences to JIW’s business were significant.

Extensive pilot training required to avoid crashing during inspections.

In under-bridge environments manual drones lose their ability to station-hold, and they revert to ATTI mode, where the pilot is responsible for all aspects of drone flight, including hovering in place. In this mode, even the most skilled pilots are hard-pressed just to keep the drone from crashing. Even attempting these flights would require large teams of highly skilled pilots for each bridge inspection.
Low-precision inspections from risk-averse flying.

To complete a bridge inspection with manual drones, the team would have had to settle for flights at long standoff distances away from the bridge. This results in a high volume of blind spots, however, as the drones are unable to look between bridge trusses to capture data obscured from far away. Even adding larger zoom lenses, such as the Zenmuse or H20T series from DJI, failed to solve the problem, as these sensors still failed to capture imagery of the underside of the bridge where the most important inspection data needs to be captured.

“The long pilot training process and dangerous flights with manual drones severely crippled our ability to build a scalable business.”

- TAKUMI SHIBATA, CEO OF JIW

Solution:

Today, JIW provides the most detailed bridge inspection reports in Japan, and can offer its customers competitive pricing thanks to Skydio. The team is contracted to inspect over 700 bridges in 2021 using their Skydio 2 aircraft, which are equipped with Skydio Autonomy Enterprise Foundation.

Skydio Autonomy onboard Skydio 2 enables safe operations in complex environments.

Thanks to 360 degree obstacle avoidance and Skydio Visual Navigator, which equips the Skydio 2 drone with unique computer vision-based flight based on the feed of six 4K navigation cameras mounted on the bottom (3) and top (3) of the drone, JIW pilots can fly with confidence under and inside bridge structures. With their Skydio drones they can focus on the inspection data they need to capture, rather than the simple survival of the aircraft.

Skydio Autonomy Enterprise Foundation (AEF) helps pilots capture more precise images.

JIW has benefitted from various features in AEF that give inspectors extra capabilities while the drone is in the air.

- Close Proximity Obstacle Avoidance allows pilots to fly through tighter gaps between bridge trusses with the confidence offered by the autonomous flight system
- Precision Mode provides sharper controller tuning to line up the perfect inspection photo
- Vertical View leverages the front-mounted gimbal design of the Skydio 2 and allows the drone to look straight up at the critical undersides of bridges, unlike manual alternatives with bottom-mounted gimbals
- Visual RTH allows for robust return-to-home procedures in the event of a lost link in a GPS-denied environment, a common death sentence for manual drones

Results: JIW’s business has grown 70x and become Japan’s market leader since adopting Skydio Autonomy

Since adopting Skydio over manual drones, JIW has been growing rapidly based on its ability to offer competitive prices based on its lower cost profile, onboard pilots more rapidly, and generate higher quality report outputs. The most notable improvement is the growth of their business, which skyrocketed from 10 bridges inspected in 2019 to a projected 700 bridges in 2021. Other notable results are:
Skydio Autonomy provides 75% cost advantages over pre-drone methods on jobs that manual drones cannot perform.

A recent study by the American Association of State Highway and Transportation Officials (AASHTO) found that the average cost to inspect a typical freeway bridge comes out to $4,600 using traditional deck inspection methods. The key cost drivers are the reduction from 16 hours to 2 hours of labor to inspect a standard bridge, and the elimination of lane closures required by the heavy machinery typically used to lower inspectors into key inspection areas. JIW has taken advantage of this cost difference to provide competitive prices to their customers, who are responsible for bridge maintenance.

JIW has on-boarded 68 new pilots in 12 months by lowering the training burden from 100 to 8 hours of flight time.

While the training requirements of manual drones would have severely limited JIW's ability to hire enough full-time drone pilots to perform a high volume of inspections nationwide, the safety blanket and ease of use provided by Skydio Autonomy has enabled the company to rapidly on-board existing bridge inspectors and other first-time drone operators. For manual drones, JIW would only interview pilots with over 100 hours of flight time and evaluated them through a test that only around 15% of candidates could pass. With Skydio, JIW hires pilots after 8 hours of training and an exam that so far every candidate has passed.

Skydio Autonomy enables inspectors to generate 3D Scans that include the underside and interior structures of bridges, which are inaccessible to manual drones that cannot fly inside the bridge structure due to their dependence on GPS and magnetometers.

"Our customers marvel at our market-leading prices, professional and highly capable pilots, and high quality inspection reports. Skydio Autonomy is vital to ensuring that we can maintain these high levels of efficiency and quality, and has helped power our business to a period of unprecedented growth."

- Takumi Shibata, CEO of JIW
SKYDIO IS THE WORLD-LEADER IN AUTONOMOUS FLIGHT TECHNOLOGY

Skydio is the leading U.S. drone manufacturer and world leader in autonomous flight technology. Skydio leverages breakthrough AI technology to create the world’s most intelligent flying machines for consumers, enterprises, defense and civilian agencies. Founded in 2014, Skydio built a world class R&D team with leading experts in AI, robotics, cameras, and electric vehicles from top companies, research labs, and universities. Headquartered in Redwood City, CA, Skydio designs, assembles, and supports its products in the U.S. to offer higher standards of supply chain and manufacturing security. Skydio is trusted by leading enterprises across a wide range of industry sectors and is backed by top investors and strategic partners including Andreessen Horowitz, IVP, Playground, Next47, Levitate Capital, NTT DOCOMO, NVIDIA.
